TASK 1: Implement a customizable web dashboard.
- The dashboard must simply contain a grid of 9 cells (check the mockup below).
- Each cell must include a colored button. On click the button must navigate the user to previously set hyperlink.
- In case the hyperlink is not set yet, then on button click the user must be navigated to another page, where the user would have the opportunity to set the button's configuration (hyperlink + color).
- Think about EDIT/DELETE scenario (in case the user wants to remove/modify the button's configuration)
- The grid must be responsive (i.e. auto-resizing based on the device resolution).
- The task includes database design (SQL), backend implementation (PHP/Laravel), frontend implementation (HTML, CSS, JavaScript).
- Please **deploy** the application on the cloud and send us the **demo link** + the **source code** (e.g. git repo) to miroslav.dzhokanov@shkolo.com
